

Mini Project

Abstract

Decentralized Medical Record & Local Clinic Coordination System (MediLock)

MediLock is a secure, web-based healthcare platform that provides a decentralized yet controlled medical record management system. It acts as a personal health locker for patients while enabling authorized access for doctors and clinics. The system ensures data privacy, reduces redundancy in medical procedures, and fosters better coordination among local healthcare stakeholders.

Technology Stack

- **Frontend:** React.js (with Redux for state management)
- **Backend:** ASP.NET Core Web API
- **Database:** Microsoft SQL Server
- **Additional Tools:** JWT Authentication, OTP Service (Twilio/SMS Gateway), Entity Framework Core, Chart.js (for analytics)

Mini Project

- Patient Registration and Profile Management
- Secure document upload (prescriptions, lab reports, discharge summaries, images)
- Role-based access control (Patient, Doctor/Clinic, Admin)
- Basic search and document categorization

Major Project

- Notification System: Reminders for medication, follow-ups, and health alerts
- Admin & Analytics Dashboard: For clinic owners and local health authorities
- **Pharmacy Assistance:** Complete list of all prescriptions given to a patient, organized doctor-wise
Patient can view every prescription with doctor name, date, medicines, dosage, and instructions
